

Use of FFR for Optimal Management of Multivessel Coronary Artery Disease

Richard G. Bach, MD

Associate Professor of Medicine
Washington University School of Medicine
Director of Cardiac Intensive Care Unit
Barnes-Jewish Hospital
St. Louis, Missouri

Disclosure:

- Research Support/Grants:
Astra Zeneca, LP, Bristol-Myers Squibb Co, Eli Lilly & Co, and Merck/Schering-Plough Pharmaceuticals
- Consulting (Clinical Event Committees):
F. Hoffman-La Roche and Wyeth/Pfizer

OUTLINE

- Case presentation
- Clinical trial data: Evidence
- Implications for clinical practice

Case Presentation:

HPI: 69 year-old woman

- 6-8 months vague chest discomfort and shortness of breath with exertion
- Remains active but more fatigued
- Definite decrease in exercise tolerance

Past Medical History

- Hyperlipidemia
- Hypertension
- Obstructive sleep apnea
- Endometrial cancer s/p hysterectomy

Nuclear stress test

- Completed at an outside facility
- Showed possible apical and inferolateral ischemia;
- Ejection fraction normal
- No discomfort during the test
- No ECG changes reported

Cardiac Catheterization done:

Coronary Angiography

Coronary Angiography

Coronary Angiography

Cardiac catheterization

- “Significant 3-vessel disease”
 - Proximal LAD: 60-70%
 - First OM: 95% at bifurcation
 - Proximal-mid RCA: diffuse 70%
- Referred for CABG
 - Patient hesitant and sought second opinion
 - Referred by new cardiologist for possible PCI

QUESTION:

What is the best option for the management of this patient?

- A. Medical Therapy (per COURAGE)
- B. Calculate the SYNTAX Score to decide on PCI vs. CABG
- C. Multivessel PCI based on angiogram
- D. FFR-guided PCI

QUESTION:

What is the best option for the management of this patient?

- A. Medical Therapy (per COURAGE)
- B. Calculate the SYNTAX Score to decide on PCI vs. CABG
- C. Multivessel PCI based on angiogram
- D. FFR-guided PCI

COURAGE: Optimal Medical Therapy

Survival Free from Death and MI (median FU 4.6 yrs)

Number at Risk

	0	1	2	3	4	5	6	7
Medical Therapy	1138	1017	959	834	638	408	192	30
PCI	1149	1013	952	833	637	417	200	35

Issues with 'COURAGE'

- Randomization
 - *only 6% of total 35,539 pts screened*
- Crossover
 - *33% at median of 4.6 years*
- Increased revascularization rate
 - *6% of PCI used no stents*
 - *97% of stents used were BMS*

QUESTION:

What is the best option for the management of this patient?

- A. Medical Therapy (per COURAGE)
- B. Calculate the SYNTAX Score to decide on PCI vs. CABG**
- C. Multivessel PCI based on angiogram
- D. FFR-guided PCI

Syntax Trial / Score

The NEW ENGLAND
JOURNAL of MEDICINE

ESTABLISHED IN 1812

MARCH 5, 2009

VOL 360 NO 10

Serruys PW et al.
NEJM 2009
360:961-72

Percutaneous Coronary Intervention versus Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease

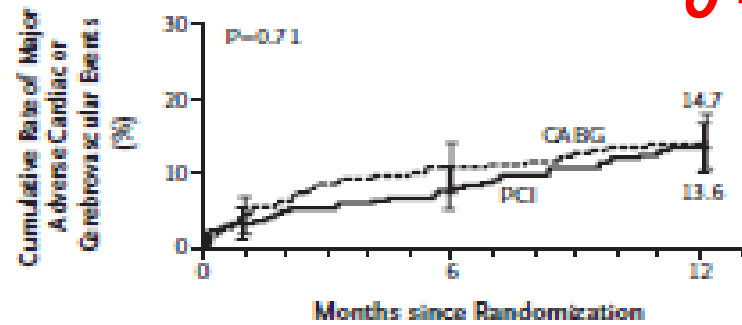

Patrick W. Serruys, M.D., Ph.D., Marie-Claude Morice, M.D., A. Pieter Kappetein, M.D., Ph.D.,
Antonio Colombo, M.D., David R. Holmes, M.D., Michael J. Mack, M.D., Elisabeth Stähle, M.D.,
Ted E. Feldman, M.D., Marcel van den Brand, M.D., Eric J. Bass, B.A., Nic Van Dyck, R.N., Karrin Leadley, M.D.,
Keith D. Dawkins, M.D., and Friedrich W. Mohr, M.D., Ph.D. for the SYNTAX Investigators*

- 1800 Patients with LM or 3V CAD
- Randomly assigned 1:1 to CABG vs. PCI
- RESULTS:
 - 1 Yr Mortality: No different
 - MACCE @ 1yr favored CABG: 12.4% vs. 17.8%

SYNTAX Results

A Low SYNTAX Score

0 -22

B Intermediate SYNTAX Score

23 -32

C High SYNTAX Score

≥ 33

Our Patient

Summary

Lesion 1

(segment 1): 1x2=	2
(segment 2): 1x2=	2
Length >20 mm	1
<i>Sub total lesion 1</i>	5

SYNTAX Score = 19

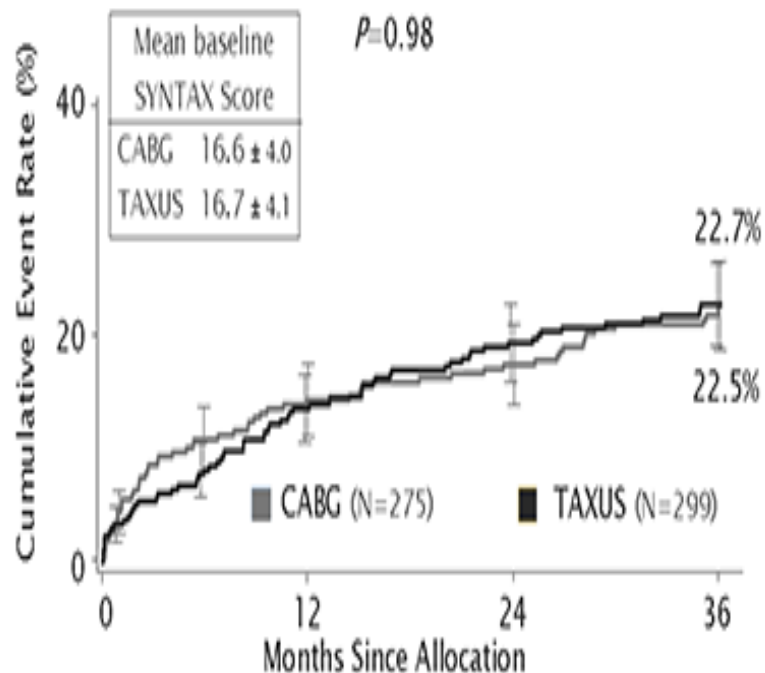

Lesion 2 (s)	
Bifurcation Type: Medina 1,1,1:	2
<i>Sub total lesion 2</i>	9

Lesion 3

(segment 12a): 1x2=	2
Bifurcation Type: Medina 1,1,1:	2
Angulation <70°	1
<i>Sub total lesion 3</i>	5

TOTAL: 19

MACCE by SYNTAX Score 0-22

The cumulative MACCE rate is displayed for the SYNTAX Trial group this score corresponds to.

QUESTION:

What is the best option for the management of this patient?

- A. Medical Therapy (per COURAGE)
- B. Calculate the SYNTAX Score to decide on PCI vs. CABG
- C. Multivessel PCI based on angiogram
- D. FFR-guided PCI

Issues with SYNTAX

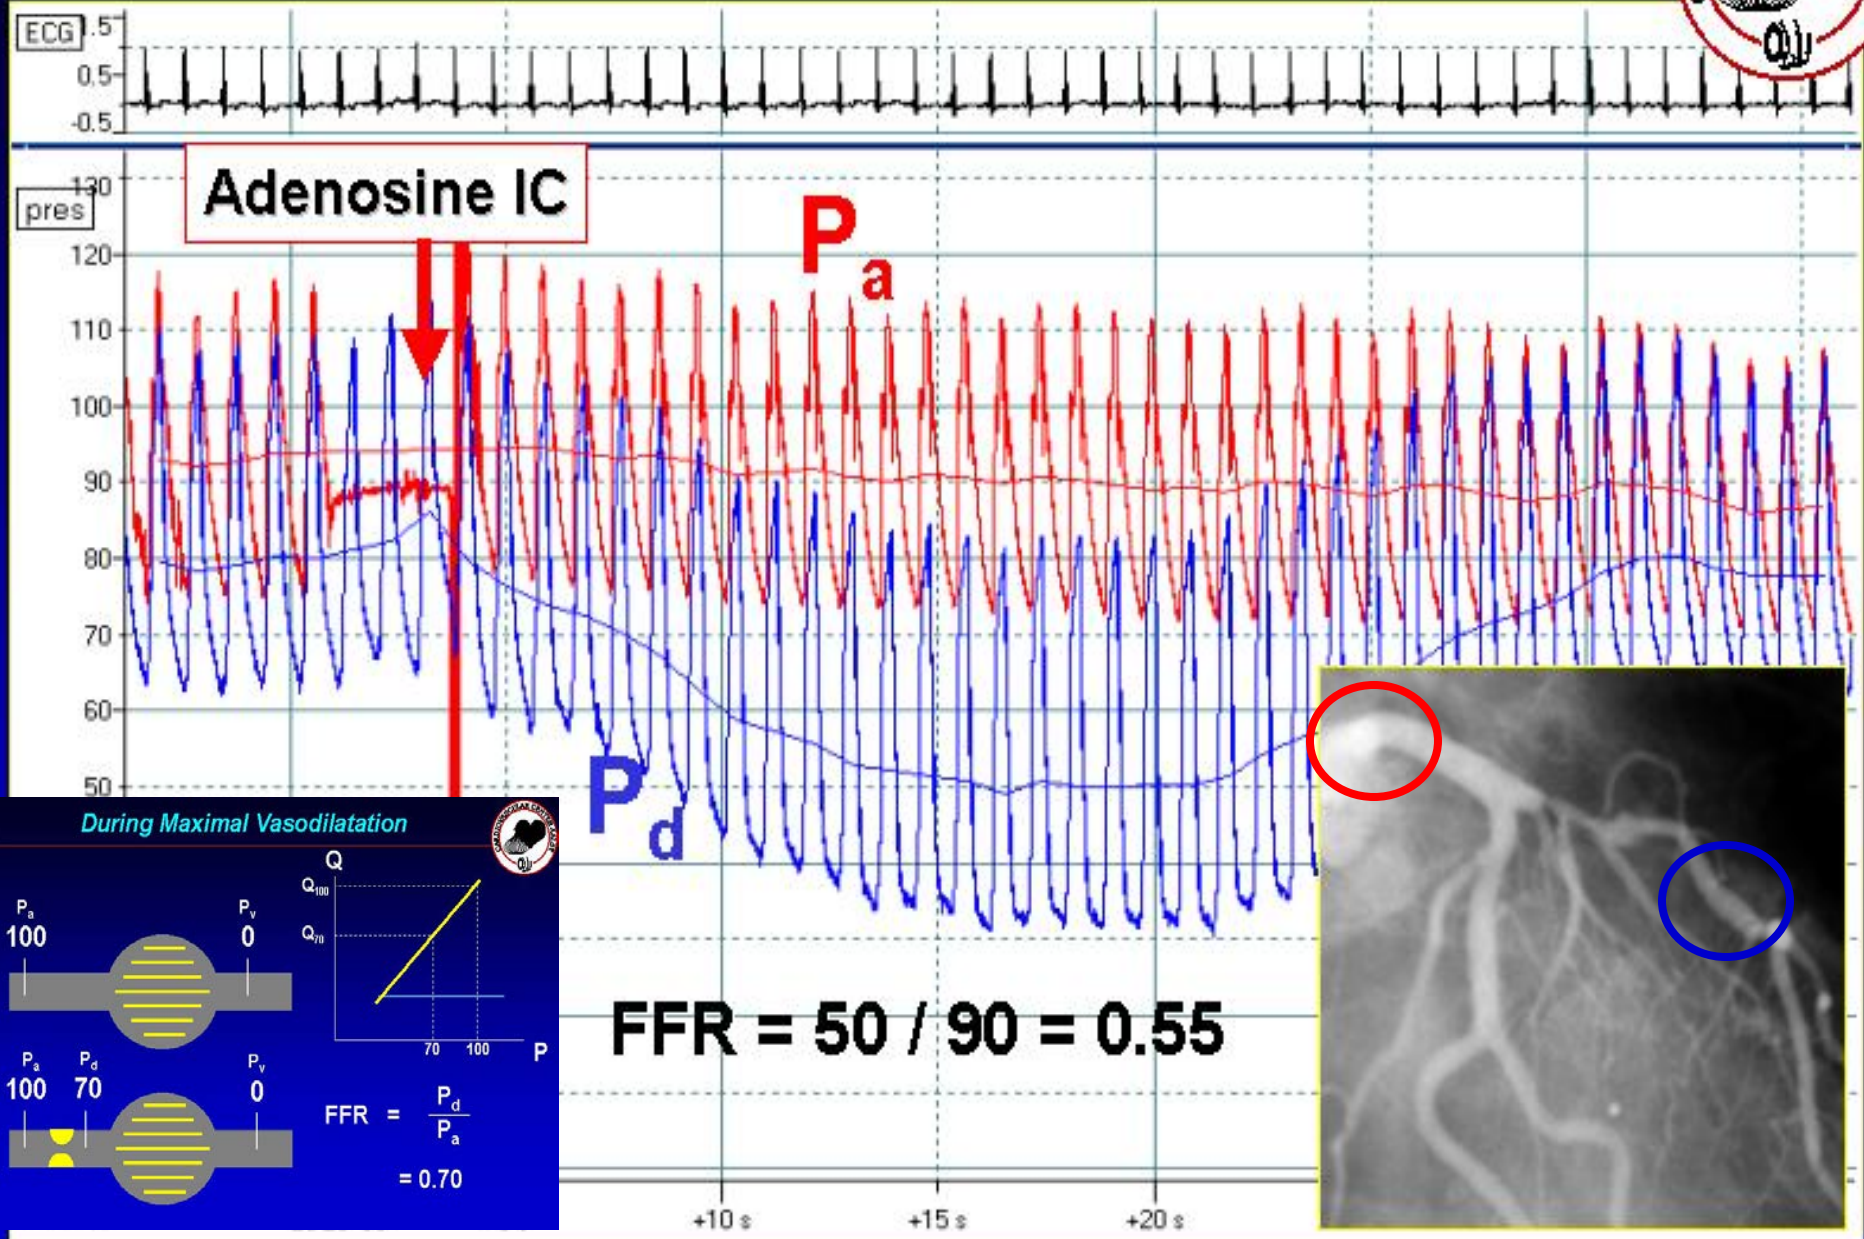

(Including Angiographic Assessment for Revascularization Decisions)

- Large number of stents implanted per patient: 4.6 ± 2.3
- Long length of stented segments:
ave 86 ± 48 mm, with stent length >100 mm
in 33%
- High rate of definite stent thrombosis
 $3.3 - 4\%$ at 1 year!

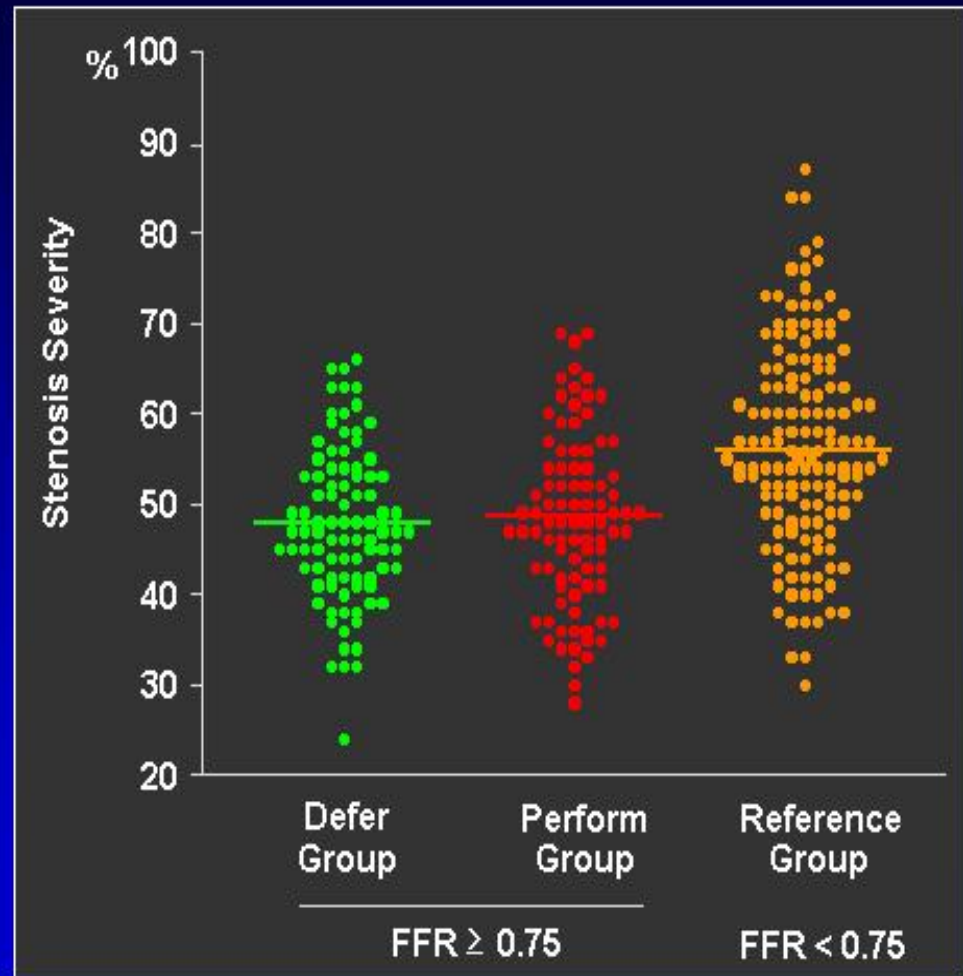

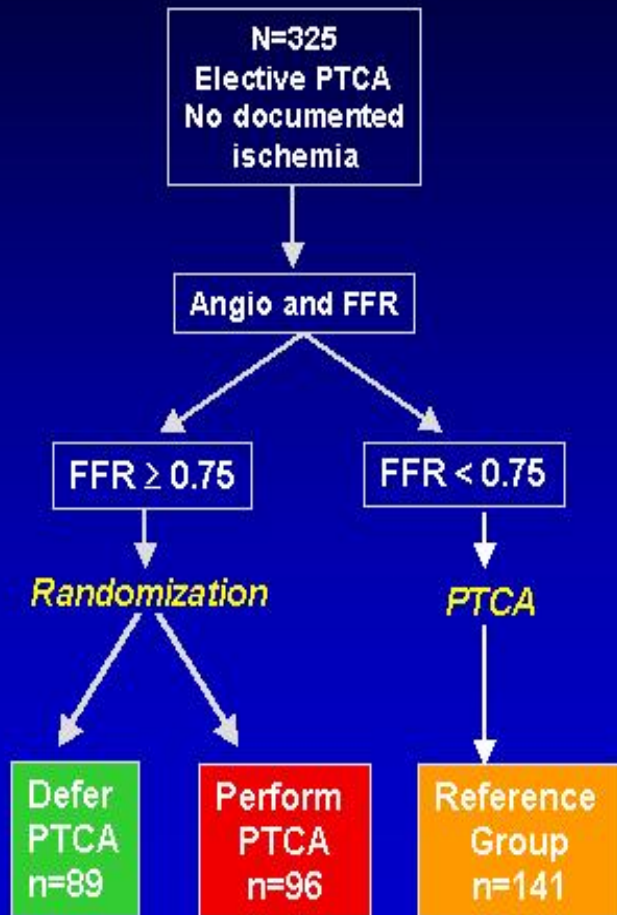

Limitations of Angiography

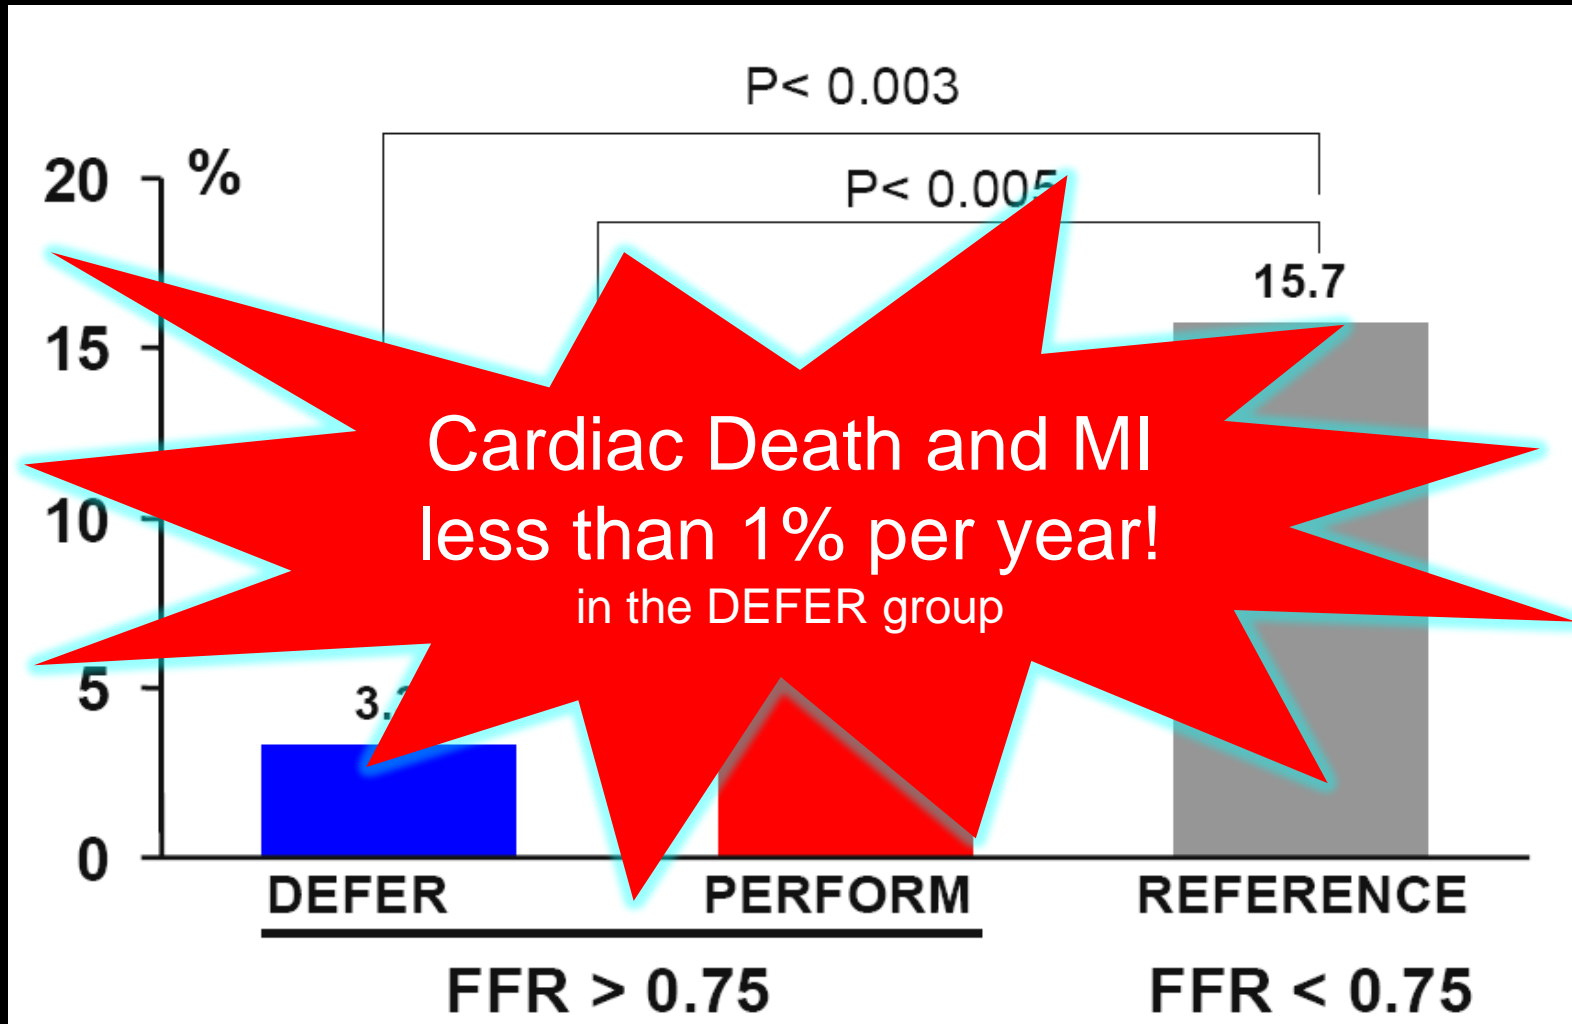

Physiologic Lesion Assessment

Defer Study: Quantitative Coronary Angiography

DEFER: 5 Year Cardiac Death and MI

FAME Study

The NEW ENGLAND JOURNAL *of* MEDICINE

Fractional Flow Reserve versus Angiography for Guiding Percutaneous Coronary Intervention

Pim A.L. Tonino, M.D., Bernard De Bruyne, M.D., Ph.D., Nico H.J. Pijls, M.D., Ph.D.,
Uwe Siebert, M.D., M.P.H., Sc.D., Fumiaki Ikeno, M.D., Marcel van 't Veer, M.Sc., Volker Klauss, M.D., Ph.D.,
Ganesh Manoharan, M.D., Thomas Engstrøm, M.D., Ph.D., Keith G. Oldroyd, M.D., Peter N. Ver Lee, M.D.,
Philip A. MacCarthy, M.D., Ph.D., and William F. Fearon, M.D., for the FAME Study Investigators*

FLOW CHART

**Patient with stenoses $\geq 50\%$
in at least 2 of the 3 major
epicardial vessels**

**Indicate all stenoses $\geq 50\%$
considered for stenting**

Randomization

Angiography-guided PCI

FFR-guided PCI

**Stent all indicated
stenoses**

**Measure FFR in all
indicated stenoses**

**Stent only those
stenoses with $FFR \leq 0.80$**

1-year follow-up

FAME: Procedural Results

	ANGIO-Group n = 496	FFR-Group n = 509	P-value
Mean # of Indicated Lesions per Patient	2.7 ± 0.9	2.8 ± 1.0	0.34
<i>FFR results</i>			
Lesions successfully measured (%)	-	1329 (98%)	-
Lesions with FFR ≤ 0.80 (%)	-	874 (63%)	-
Lesions with FFR > 0.80 (%)	-	513 (37%)	-
Stents per patient	2.7 ± 1.2	1.9 ± 1.3	<0.001
Lesions successfully stented (%)	92%	94%	-
Total DES	1359	980	-

★ FFR-guided group used 0.8 less stents per patient!

FAME study: Event-free Survival

Absolute Difference in MACE-free survival

Angiographic Versus Functional Severity of Coronary Artery Stenoses in the FAME Study

Fractional Flow Reserve Versus Angiography in Multivessel Evaluation

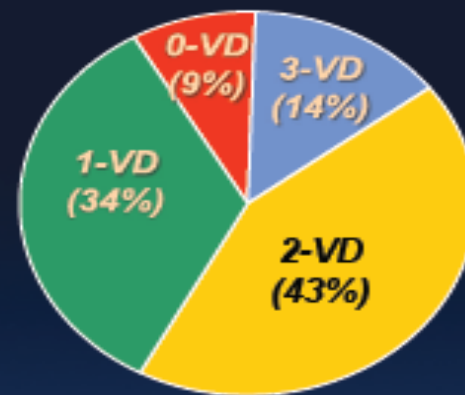

Pim A. L. Tonino, MD,* William F. Fearon, MD,† Bernard De Bruyne, MD, PHD,‡

Philip A. MacCarthy, MD, PHD,# Marcel van't Veer, MSC, PHD,* Nico H. J. Pijls, MD, PHD*

Eindhoven, the Netherlands; Stanford, California; Aalst, Belgium; Glasgow and London, United Kingdom; Cincinnati, Ohio; and Bangor, Maine

FAME: Angiographic vs. Functional NDV

Pts with angiographic 3VD
(%DS >50%)
N=115

QUESTION:

What is the best option for the management of this patient?

- A. Medical Therapy (per COURAGE)
- B. Calculate the SYNTAX Score to decide on PCI vs. CABG
- C. Multivessel PCI based on angiogram
- D. FFR-guided PCI**

**Our
Patient**

Coronary Angiography: LAD FFR

FFR Assessment: LAD

- Eccentric, calcified, hazy 70% lesion
 - Pressure wire (Volcano Prestige) equalized in the left main and passed into the mid LAD
 - Resting FFR decreased to 0.95
- Adenosine 60mcg and 120mcg
 - FFR 0.89, 0.91
- *Final result*
 - *Lesion physiologically not significant...*
 - *PCI Deferred*

Coronary Angiography: LCA

PCI of Bifurcating OM with JBT

Post-PCI of OM

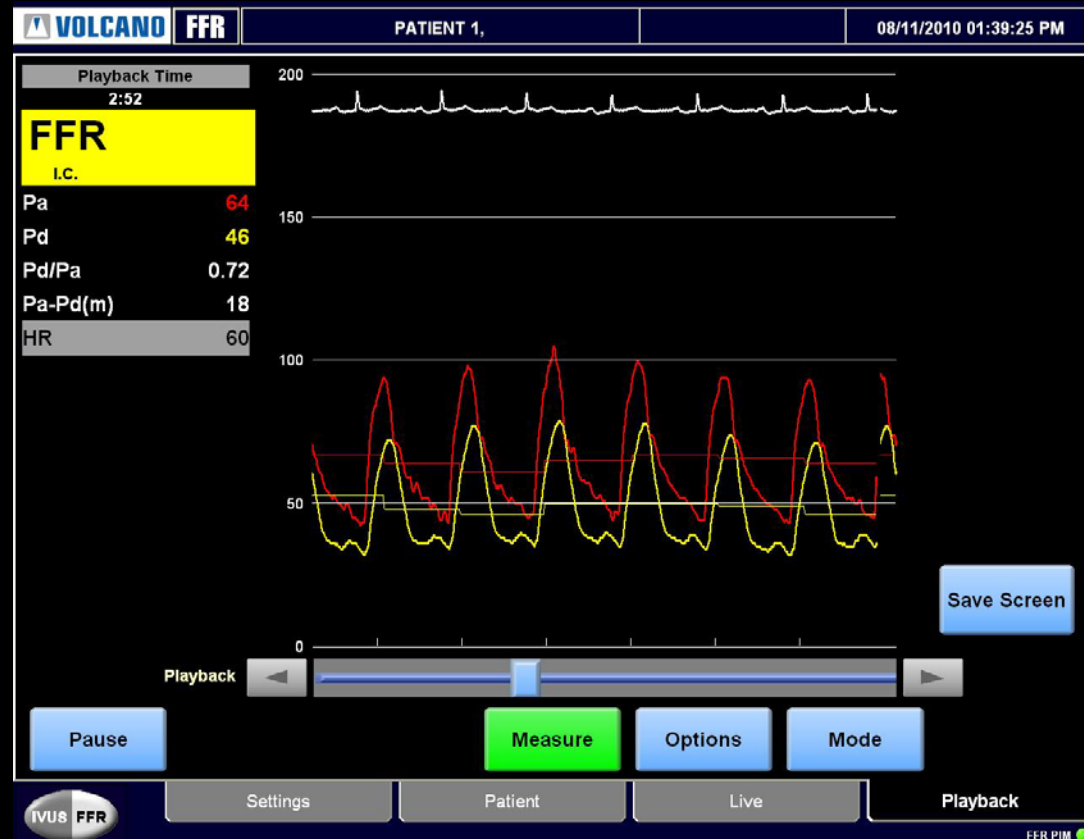

Coronary Angiography: RCA

FFR Assessment: RCA

- Eccentric, hazy, long 70% lesion
 - Volcano Prestige wire equalized in the proximal RCA and passed distally into the PDA
- Adenosine 30 mcg
 - **FFR 0.72**
- *Final result*
 - *Physiologically significant*

PCI of RCA

Post-PCI of RCA

Follow-up...

- Patient with uncomplicated recovery...discharged in good condition
- ASA indefinitely
- Clopidogrel minimum one year
- Clinically improved...
 - No further chest tightness reported
 - Improved exercise tolerance

Conclusions

- In appropriately selected patients with multivessel CAD, a strategy of FFR-guided PCI can provide symptomatic benefit with strong evidence of superior outcomes, even at reduced cost.

Heart & Vascular Center

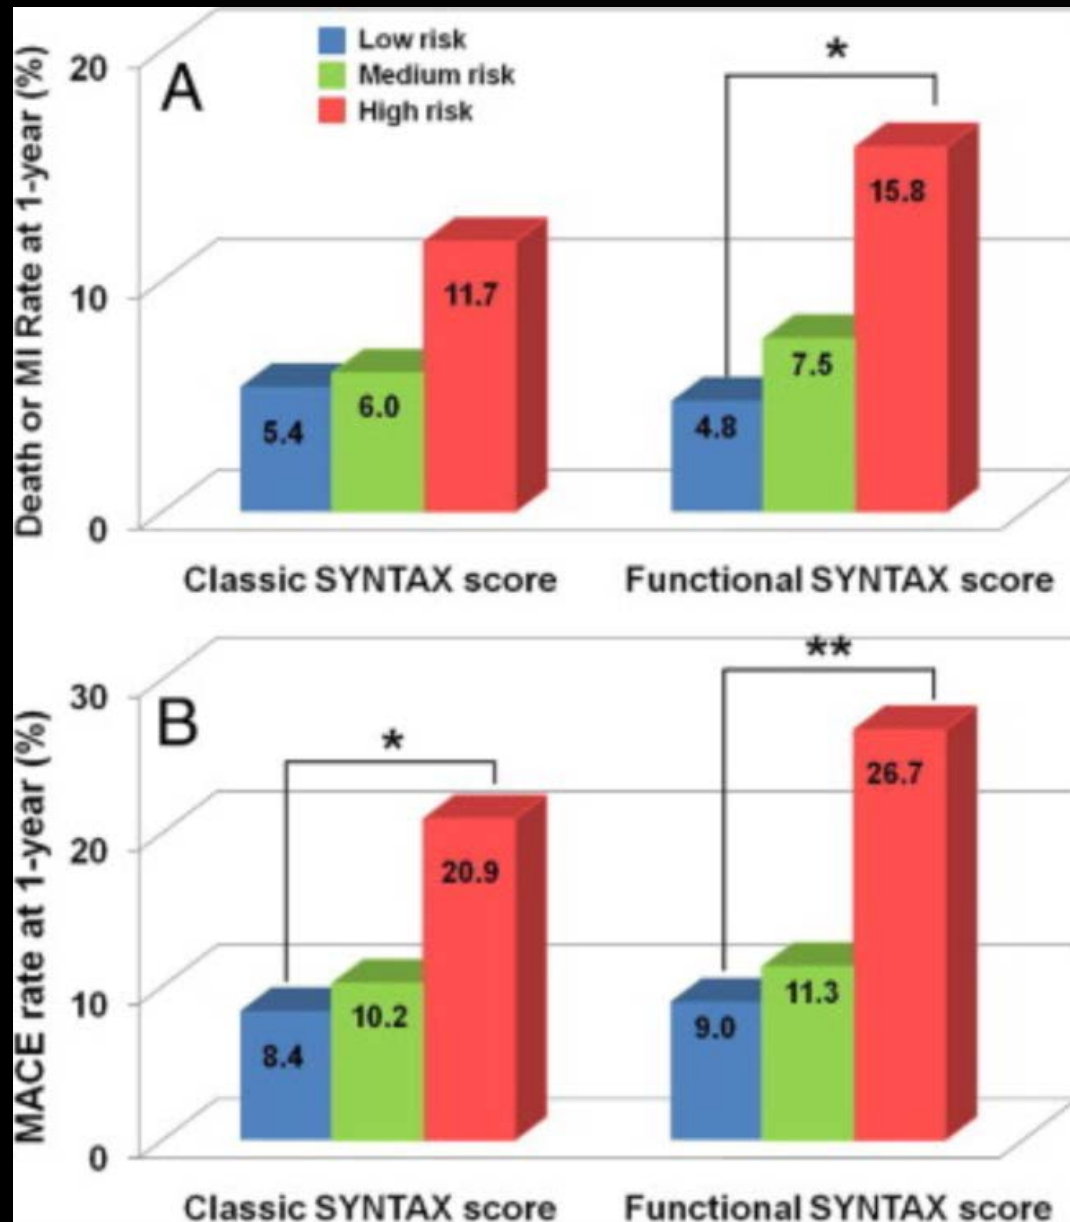

NATIONAL LEADERS IN MEDICINE

FAME: Patient Outcomes

	ANGIO-Group n = 496	FFR-Group n = 509	P-value
Events at 1 year, # (%)			
Death, MI, CABG, or repeat-PCI	91 (18.4)	67 (13.2)	0.02
Death	15 (3.0)	9 (1.8)	0.19
Death or MI	55 (11.1)	37 (7.3)	0.04
CABG or repeat PCI	47 (9.5)	33 (6.5)	0.08
Total # of MACE	113	76	0.02

- ★ MACE rates in the FFR-guided group are 28% lower than the Angio-guided group!
- ★ Death or MI in the FFR-guided group is 34% lower than in the Angio-guided group!

Keith G. Oldroyd, M.D., Kreton Mavromatis, M.D., Ganesh Manoharan, M.D.,
Peter Verlee, M.D., Ole Frobert, M.D., Nick Curzen, B.M., Ph.D.,
Jane B. Johnson, R.N., B.S.N., Peter Jüni, M.D., and William F. Fearon, M.D.,
for the FAME 2 Trial Investigators*

FAME 2: Trial Design

Stable patients with 1, 2, or 3 vessel CAD evaluated for PCI with DES
n=1220

FFR in all target lesions

Randomized Trial

At least 1 stenosis with
FFR ≤ 0.80 (n=888)

Randomization 1:1

PCI + MT

MT

73%

Registry

All FFR > 0.80
(n=322)

MT

27%

50% randomly assigned to
follow-up

Primary Endpoint: Death, MI, Urgent Revascularization at 2 years

FAME 2: Primary Outcome: Death, MI, Unplanned Hospitalization with Urgent Revascularization

No. at risk

MT	441	414	370	322	283	253	220	192	162	127	100	70	37
PCI+MT	447	414	388	351	308	277	243	212	175	155	117	92	53
Registry	166	156	145	133	117	106	93	74	64	52	41	25	13

FAME 2: Urgent Revascularization

No. at risk

MT	441	414	371	325	286	256	223	195	164	129	101	71	38
PCI+MT	447	421	395	356	315	285	248	217	180	160	119	93	53
Registry	166	156	145	133	117	106	94	75	65	53	42	26	13

FAME 2: Conclusions

- In patients with stable coronary artery disease, FFR-guided PCI, improves patient outcome as compared with medical therapy alone
- This improvement is driven by a dramatic decrease in the need for urgent revascularization for ACS
- In patients with functionally non-significant stenoses medical therapy alone resulted in an excellent outcome, regardless of the angiographic appearance of the stenoses
